Use Core to the protein core protein cylonoly. The core protein cylonoly yalvanety to genotype 2, N2

A; Abriety; genotype 2, N2

C; Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000

C; Accession: 841353

R; Wan Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.

Submitted to the EMBL Data Library, January 1994

A; Description: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.

A; Reference number: $4131

A; Accession: 841353

A; Accession: 841353

A; Residues: 1-108 < VAN.

A; Residues: EMBL: 229456

A; Experimental source: genotype 2, N2

C; Superfamily: hepatitis C virus genome polyprotein

C; Keywords: capsid protein; core protein; polyprotein

F; 1-108/Product: core protein #status predicted <NAT>

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

N.Contains: core protein
C.Speciaes: hepatitis C virus
A.Variety: genotype 5, N2
Ate: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C.Cessaion: 841368
N.Yan Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.
Submitted to the EMBL Data Library, January 1994
A.Pescription: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.
A.Reference number: 841368
A.Accession: 841368
A.Accession: 841368

genome polyprotein - hepatitis C virus (genotype 2, N3) (fragment)
Nicontains: core protein
Netles: hepatitis C virus
ridety: genotype 2, N3
Liety: genotype 3, N3
Liety: genotype 2, N3
Liety: genotype 3, N3
Rivan Doorn, LiJ.; Kleter, G.E.M.; Brouwer, J.T.
submitted to the EMBL Data Library, January 1994
A.Description: Analysis of hepatitis C virus genotypes 1 to 5 by Liph.
A.Reference number: S41341
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Species: hepatitis C virus

"Genomic characterization and mutation rate of hepatitis C virus isolated from a patient who contracted hepatitis during an epidemic of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN EVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus (isolate HCV-KF) (HCV).

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MNAN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-9223023: PubMed-1314459;

-1- FUNCTION: THE SMALL PROFEINS NS2A, NS2B, NS4A AND NS4B ARE HYDOLOGY SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROFEINS: PROFEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA stage; Flaviviridae;

Protein Sci. 7:837-847(1998).

- I- FUNCTION: THE SWALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDOPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RLATED FUNCTION.
NS3 AND NS5 AMY PLAY A ROLLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 AMY PLAY A ROLLE IN THE VIRAL RNA REPLICATION.
C CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral presence of precursor polyprotein, commonly with Asp or Giu in the P6 precursor polyprotein.
C CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein El (GP6) (RS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).

Core protein; Coat protein; Envelope protein; Helicase; ATP-binding;
Transmembrane; Nonstructural protein; Hydrolase; Serine protease;
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-!- PTW: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
-!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
-!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POTENTIAL.

         Genome polyprotein (Contains: Capsid protein ( (Core protein) (P22); Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP69) (GN31); Protein P7: Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS48 (P4); Nonstructural protein NS58 (P56); Nonstructural protein NS58 (P65) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)]. Hepatitis C virus (Lapolate HC-J8) (HCV).
                                                                                                                                                                                                                                                                                          JIOOGY 188:331-341(1992).

-I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                -1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                  MEDLINE-92230232; PubMed-1314459; Okamoto K., Lizuka H., Tanaka Okamoto H., Kurai K., Okada S.-I., Yamamoto K., Lizuka H., Tanaka Bukuda S., Tsuda F., Mishiro S.; "Full-length sequence of a hepatitis C virus genome having poor homology to reported isolates: comparative study of four distinct genotypes.";

Bradley D.W., Kuo G., Houghton M.;
Proc. Natl. Acad. Sci. U.S.A. 88:2451-2455(1991).
- Frunction: THE SMALL PROFEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELAATED FUNCTION.
- SUGGESTING A POSSIBLE MEMBRANE RELAATED FUNCTION.
- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postion, Cys or Thi in Pl and Ser or Ala in Pl'.
- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                         (RNA)(N).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOSIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1.

-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (RNA)(N).
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

Hotta H., Handajani R., Ingelusida M., Soemarto W., Doi H.,
Miyajima H., Homma M.;
Subtype analysis of hepatitis C virus in Indonesia on the basis of
NS5b region sequences.;
J. Clin. Microbiol. 32:3049-3051(1994).
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GIXCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MANA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polyak S.J., Miller K., McArdle S., Gale M.J. "Hepatitis C virus quasispecies in cancerous and non-cancerous hepatic
                                                                                                            lesions.";
submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.
-!- SUBMITT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 6, Ap

TITLE OF INVENTION: NEW SEQUENCES OF HEPATITIS C VIRUS GENOTYPES
AND THEIR USE AS PROPHYLACTIC, THERAPEUTIC AND DIAGNOSTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
          US-09-921-397-77

Sequence 77, Application US/09921397

Sequence 77, Application US/09921397

Patent No. US20020151484a1

GENERAL INFORMATION:

APPLICANT: HYBRIGENICS

TITLE OF INVENTION: pathogenic strain of the hepatitis C virus and TITLE OF INVENTION: applications thereof

FILE REFERENCE: B4809A - JAZ

CURRENT APPLICATION NUMBER: US/09/921,397

CURRENT FILING DATE: 2001-08-02

PRIOR APPLICATION NUMBER: EP 00402225.7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               COMPUTER: IBM PC compatible
